### Resumo

**Espécies de *Amauroderma* (Ganodermataceae) no Estado de Santa Catarina, Sul do Brasil.** Seis espécies de *Amauroderma*, *A. brasiliense*, *A. camerarium*, *A. intermedium*, *A. omphalodes*, *A. schomburgkii* e *A. sprucei* ocorrem em Santa Catarina. Chave para identificação e comentários sobre as espécies são apresentados.

**Palavras-chave:** Mata Atlântica; Micodiversidade; *Polyporales*

### Abstract

Six species of *Amauroderma*, *A. camerarium*, *A. brasiliense*, *A. intermedium*, *A. omphalodes*, *A. schomburgkii* and *A. sprucei*, occur in the Santa Catarina. An identification key and comments about the species are presented.

**Key words:** Altantic Forest; Mycodiversity; *Polyporales*

### Introduction

The genus *Amauroderma* was created by Murrill (1905) with *Fomes regulicolor* Berk. ex Cooke (= *Amauroderma schomburgkii* (Mont. & Berk.) Torrend), from Cuba, as the holotype. Afterwards, Torrend (1920) worked on the genus in South America and, based mainly on spore shape (globose or oblong, never truncate) and the presence of a stipe (usually dull, like the pilear surface), published an important

work that recorded 28 species of *Amauroderma* placed within three sections. Later, *Amauroderma* was carefully revised by Furtado (1981), who recognized 27 species. Furtado defined *Amauroderma* by the globose to subglobose basidiospores, with double walls, stipitate basidiomes and a tropical distribution pattern. Ryvarden (2004) described 21 species of *Amauroderma* from the Neotropics, using the same genus circumscription. However, according to Index Fungorum (2012), there are 85 binomials of this genus.

Recently, Campacci and Gugliotta (2009) published a bibliographic review on *Amauroderma* from Brazil, in which 20 species were accepted and 10 taxa were excluded because they belong to other genera or had insufficient data and/or dubious names.

In the state of Santa Catarina there are records of six species of *Amauroderma* (LOGUERCIO-LEITE et al., 2009; CAMPOS-SANTANA; LOGUERCIO-LEITE, 2010). In the present work, a review of the *Amauroderma* species from the herbarium FLOR was made to determinate their occurrence in this region. In addition, comments and an identification key are presented.

## Materials and Methods

The study was based on collections of *Amauroderma* species from Santa Catarina State ( $26^{\circ}$ - $30^{\circ}$ S,  $48^{\circ}30'$ - $54^{\circ}$ W). Macroscopic and microscopic data of the specimens were obtained following traditional methodologies (SINGER, 1975; RYVARDEN, 1991) and the colors were determined according to Munsell (1975). All specimens are deposited in the herbarium FLOR at the Universidade Federal de Santa Catarina. Herbarium acronyms are based on Holmgren et al. (1990). Specimens were identified and the geographical distributions were determined using literature about the Ganodermataceae.

## Taxonomy

### *Amauroderma brasiliense* (Singer) Ryvarden

**Synopsis Fungorum** 19: 44, 2004.

≡ *Scutiger brasiliensis* Singer. Nova Hedwigia, Beih. 17:22, 1983.

**Description** in Gulaid & Ryvarden (1998).

**Distribution:** Neotropical, Brazil and Venezuela (RYVARDEN, 2004). In Brazil cited from the states of Amazônia (holotype), Paraná, Rio Grande do Sul, Rondônia, Santa Catarina and São Paulo (SINGER et al., 1983; GULAIID; RYVARDEN, 1998; RYVARDEN; MEIJER, 2002; GROPOSO; LOGUERCIO-LEITE, 2005; MEIJER, 2006; COELHO et al., 2007; CAMPACCI; GUGLIOTTA, 2009).

**Comments:** The material examined is typical for this species. It is (= *Amauroderma corneri* Gulaid & Ryvarden) recognized by its fleshy, fan-shaped basidiomes that are fragile when dry. It is also distinct because of its whitish color when compared with others species of the genus, which are often shades of brown. Further, the generative hyphae are dominant and some skeletal hyphae, which are usually smooth or occasionally tuberculate, show apical swellings (GULAIID; RYVARDEN, 1998).

**Examined material:** BRAZIL, Santa Catarina, Santo Amaro, Parque Estadual Serra do Tabuleiro, Vargem Braço. C. Groposo 110, 28/III/2001 (FLOR 31323).

***Amauroderma camerarium* (Berk.) J. S. Furtado.**

**Rev. Gen. *Amauroderma*:** 140, 1968.

≡ *Polyporus camerarius* Berk. Lond. J. Bot. 8: 143, 1856.

**Description** in Furtado (1981).

**Distribution:** Neotropical, Brazil, Belize, Colombia, Cuba, Honduras, Peru and Venezuela (FURTADO, 1981; RYVARDEN, 2004). In Brazil cited from the states of Amazônia (holotype), Bahia, Mato Grosso, Paraná, Pernambuco, Rio de Janeiro, Rio Grande do Sul and Santa Catarina (RICK, 1960; FURTADO, 1981; RAJCHENBERG; MEIJER, 1990; SILVEIRA; GUERREIRO, 1991; GÓES-NETO, 1999; RYVARDEN; MEIJER, 2002; GROPOSO; LOGUERCIO-LEITE, 2005; MEIJER, 2006; CAMPACCI; GUGLIOTTA, 2009).

**Comments:** Furtado (1981), when examining the holotype (Sprucei 171), pointed out the presence of yellowish basidiospores, a characteristic also found in our specimen; this is a good way to distinguish this species from *Amauroderma schomburgkii* that has hyaline basidiospores. However, Furtado also reported the larger basidiospores ( $10\text{-}13 \times 9\text{-}11 \mu\text{m}$ ) compared to the specimen at FLOR 11902 ( $[8.8]9\text{-}11 \times [7.5]8\text{-}9[10] \mu\text{m}$ ). The same author stated that the separation between *A. camerarium* and *A. omphalodes* is even more confusing. Ryvarden (2004) emphasized the presence of dextrinoid skeletal hyphae and the large basidiospores ( $12\text{-}15[-16] \times 10\text{-}13 \mu\text{m}$ ) as the most distinctive features

of this species, although this is quite different from what we observed.

**Examined materials:** BRAZIL, Santa Catarina, Santo Amaro da Imperatriz, Hotel Plaza, Trilha Cascata, Serra do Tabuleiro, Groposo 097, 05/I/2001 (FLOR 11902).

*Amauroderma intermedium* (Bres. & Pat.)  
Torrend.

**Brotéria, ser. bot. 18:** 128. 1920

≡ *Ganoderma intermedium* Bres. & Pat. Bull.  
Soc. Mycol Fr. 5:76, 1889.

**Description** in Ryvarden (2004).

**Distribution:** Neotropical, Brazil, Guadalupe, Martinique, Paraguay and Puerto Rico (TORREND, 1920; RYVARDEN, 2004). In Brazil cited from the states of Amazônia, Rio de Janeiro, Rio Grande do Sul, Santa Catarina and São Paulo (TORREND, 1920; FURTADO, 1981; LOGUERCIO-LEITE et al., 2009).

**Comments:** *Amauroderma intermedium* presents pale-yellowish, finely asperulate, sub-globose basidiospores ( $8-11 \times 7-8\mu\text{m}$ ). Furtado (1981) regards it as *Amauroderma rude* var. *intermedium*. However, Ryvarden (2004) considers *A. intermedium* an independent taxon. Both authors reported similar basidiospores size and very conspicuous endosporic projections.

**Examined materials:** BRAZIL, Santa Catarina, Santo Amaro da Imperatriz, Hotel Caldas da Imperatriz, T-Pereira, s/n. 31/III/2007 (FLOR 32197); ibid, ipse, 10/XI/2007 (FLOR 32198).

*Amauroderma omphalodes* (Berk.) Torrend

**Brotéria, ser. bot 18:** 131, 1920.

≡ *Polyporus omphalodes* Berk. Lond. J. Bot. 8:  
172, 1856.

**Description** in Furtado (1981).

**Distribution:** Neotropical, Brazil, Guyana, Venezuela and Colombia (RYVARDEN, 2004). In Brazil cited from the states of Amazônia, Alagoas, Bahia, Rio de Janeiro, Mato Grosso, Paraná, Pernambuco, Sergipe and

Santa Catarina (TORREND, 1920; FURTADO, 1981; RYVARDEN, 1984; LOGUERCIO-LEITE; WRIGHT, 1991; GÓES-NETO, 1999; RYVARDEN; MEIJER, 2002; GIBERTONI et al., 2004; DRECHSLER-SANTOS et al., 2008; CAMPACCI; GUGLIOTTA, 2009).

**Comments:** Furtado (1981) pointed out that this species is very similar to *Amauroderma camerarium* and *A. sprucei*, mainly because of the light colored context. However, *A. camerarium* differs in the pilear cover, which is formed by a cortex, and *A. sprucei* can be distinguished by the size ( $11-13 \times 9-11\mu\text{m}$  in *A. omphalodes* and  $9-10 \times 7-8\mu\text{m}$  in *A. sprucei*) of the basidiospores (FURTADO, 1981).

**Examined materials:** BRAZIL, Santa Catarina, Florianópolis, Rio Tavares, Furlani 274, 04/VII/1986 (FLOR 10460).

*Amauroderma schomburgkii* (Mont. & Berk.)  
Torrend

**Brotéria, ser. bot. 18:** 140. 1920.

≡ *Polyporus schomburgkii* Mont. & Berk. Lond.  
J. Bot. 3:331. 1844

**Description** in Furtado (1981).

**Distribution:** Neotropical, Brazil, Colombia, Costa Rica, Cuba, Guiana Francesa, Guiana, Venezuela, Jamaica, Nicarágua, Panamá and Trinidad (TORREND, 1920; CORNER, 1983; RYVARDEN, 2004). In Brazil cited from the states of Amazônia, Bahia, Mato Grosso, Pará, Paraná, Pernambuco, Rio de Janeiro, Rio Grande do Sul, Rondônia, Santa Catarina, Sergipe and São Paulo (TORREND, 1920; FURTADO, 1981; CORNER, 1983; RAJCHENBERG; MEIJER, 1990; GÓIS-NETO, 1999; RYVARDEN; MEIJER, 2002; SOTÃO et al., 2002; GIBERTONI et al., 2004; MEIJER, 2006; CAMPACCI; GUGLIOTTA, 2009; CAMPOS-SANTANA; LOGUERCIO-LEITE, 2010).

**Comments:** This species is characterized by its small pores ( $5-7/\text{mm}$ ), the globose basidiospores that are  $7-9(-11) \times 7-9\mu\text{m}$ , and the yellowish to citric yellow arboriform skeletal hyphae that are  $5-8(-10)\mu\text{m}$  wide. According to Furtado (1981), this species is the most

common of the genus in the Neotropics. The specimen FLOR 31344 was found growing on roots on soil. There are other examples of *Amauroderma* species growing on the soil, such as *A. coltricioides* T. W. Henkel, Aime & Ryvarden recorded by Silveira et al. (2008) and *A. calcigenum* (Berk.) Torrend recorded by Gomes-Silva et al. (2010).

**Examined materials:** Brazil, Santa Catarina, Hercílioópolis, Água Doce, Folle & Willerding 046, 23/VIII/1992 (FLOR 11104); ipse, ibid, 047 (FLOR 11105); Ilhota, Morro Baú, C. Groposo s/n, /VII/2003 (FLOR 31344); Alfredo Wagner, Rio das Furnas, A. Gerlach & Giovanka 136, 07/VII/2008 (FLOR 32345).

*Amauroderma sprucei* (Pat.) Torrend

**Brotéria ser. bot. 18:** 121, 1920.

≡ *Ganoderma sprucei* Pat. Bull. Soc. Mycol. Fr. 10:75, 1894.

**Description** in Decock & Herrera Figueroa (2006) [*stricto sensu*].

**Distribution:** Neotropical, Brazil, Costa Rica, Colombia, Cuba, Puerto Rico, Jamaica, Belize, French Guiana and Venezuela (RYVARDEN, 2004; CAMPACCI; GUGLIOTTA, 2009). In Brazil cited from the states of Amazônia, Minas Gerais, Mato Grosso, Pará, Paraná, Pernambuco, Rio de Janeiro, Rio Grande do Sul, Santa Catarina, São Paulo and Sergipe (RICK, 1960; TORREND, 1920; FURTADO, 1981; CORNER, 1983; RAJCHENBERG; MEIJER, 1990; RYVARDEN; MEIJER, 2002; RYVARDEN, 2004; GIBERTONI et al., 2004; DECOCK; HERRERA FIGUEROA, 2006).

**Comments:** This species is characterized by a stipitate to occasionally subsessile basidiome, a dull brown (chocolate brown) pileus, a reddish yellow pore surface, small pores (7–8/mm) and a whitish context (DECOCK; HERRERA FIGUEROA, 2006). Previously, Ryvarden (2004) considered *A. sprucei* as an independent taxon from *A. dubiopansum* because of its brilliant pore surface and the strong dextrinoid reaction on skeletal hyphae.

**Examined material:** BRAZIL, Santa Catarina, Mondaí,

Linha Uruguai, M. Campos-Santana 190, 27/XII/2006 (FLOR 32210).

### Key to *Amauroderma* in Santa Catarina State

- |   |                        |
|---|------------------------|
| 1 Pores 1–4 per mm .....  | 2                      |
| 1' Pores 5–8 per mm .....   | 3                      |
| 2 Pores 1–2 per mm, basidiospores globose, 6.5–8.5µm in diameter, hyaline to pale yellow .....        | <i>A. brasiliense</i>  |
| 2' Pores 2–4 per mm, basidiospores sub-globose, 8–11 × 7–8µm, yellowish .....                         | <i>A. intermedium</i>  |
